

Chemicals of emerging concern in waters, sediments, and subsistence fish used by the Grand Portage Band of Chippewa

Seth Moore, Grand Portage Band of Lake Superior Chippewa

Tiffany Wolf, University of Minnesota

Jessica Deere, University of Minnesota

Mark Ferrey, Minnesota Pollution Control Agency

Mark Jankowski, U.S. Environmental Protection Agency

Mateo Convertino, University of Minnesota

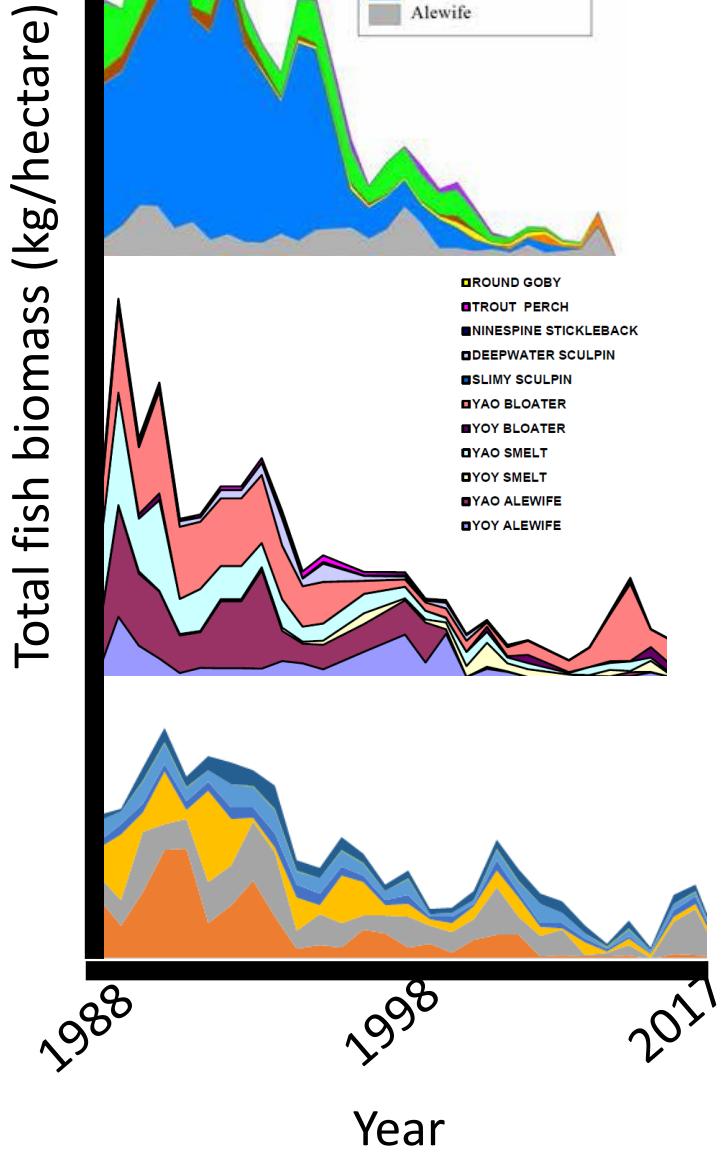

Nicholas Phelps, University of Minnesota

Alexander Primus, University of Minnesota

Dominic Travis, University of Minnesota

Great Lakes fish biomass

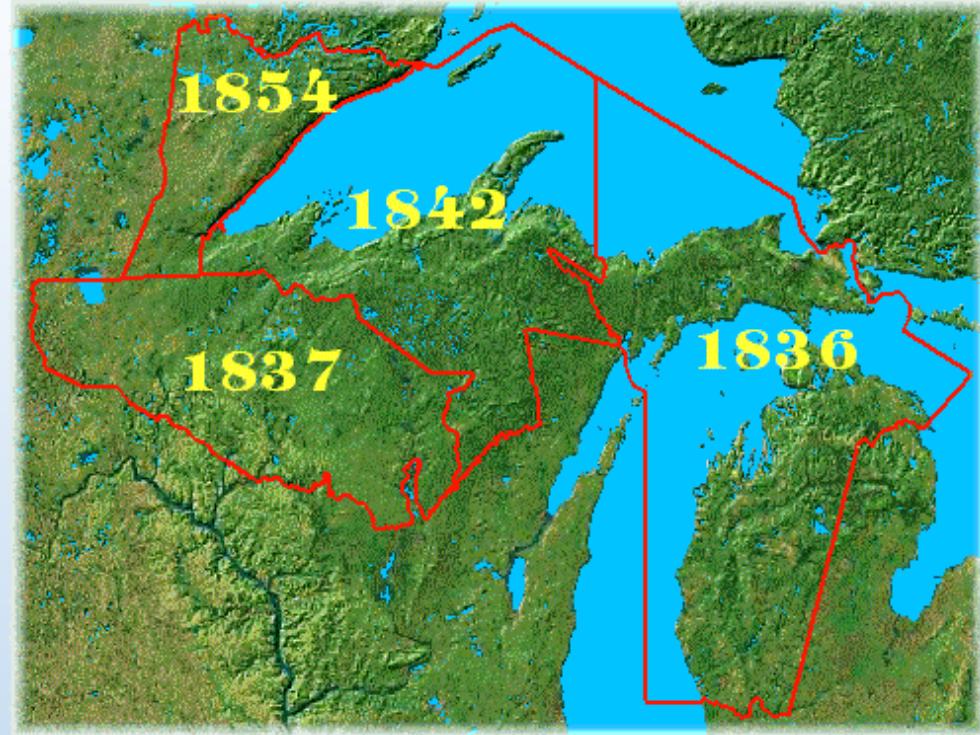

Lake Michigan
89% decline

Lake Huron
87% decline

Lake Superior
80% decline

Concerns

- Ecological effects

Chemical detection

- Water
- Sediment
- fish

Biological effects

- Stress
- Parasites
- Fitness
- Reproductive state

Ecological effects

- Community structure

Human/Biological impacts

Diclofenac

Introduced to India for treatment of livestock in 1990s

Lethal to Gyps vultures

- Visceral gout in internal organs and acute renal tubular necrosis

The contamination of 1/760 livestock carcasses is sufficient to explain collapse in vulture population

Led to rabies increase

Biological Effects

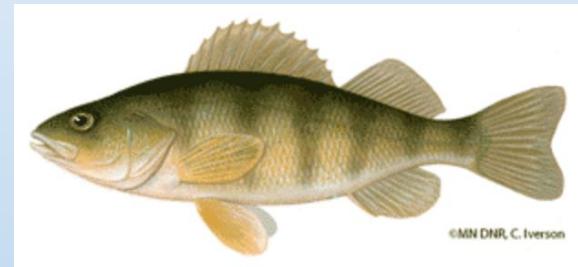

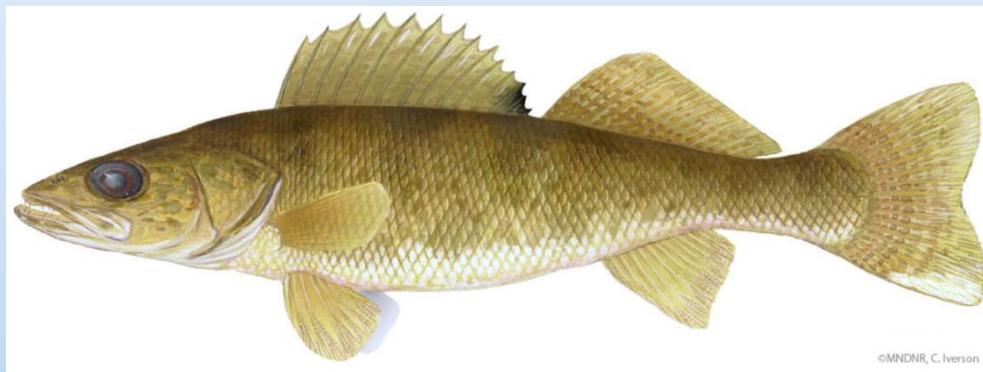

- ✓ Dosing an experimental lake with 5 parts per trillion of the synthetic estrogen ethinylestradiol caused the minnow population to collapse.
- ✓ 30 parts per trillion fluvoxamine (an SSRI) in water triggers immediate spawning in mussels.
- ✓ Fish behavior is altered after exposure to 1 part per trillion of estradiol.
- ✓ Iopamidol + Chlorine = triiodomethanes (highly toxic compounds).

Experimental Design

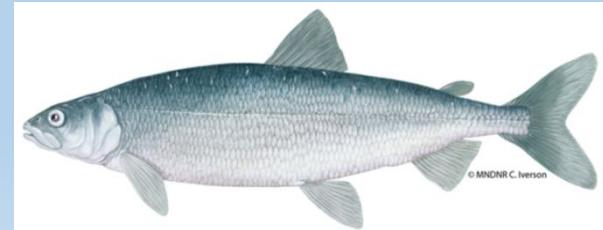

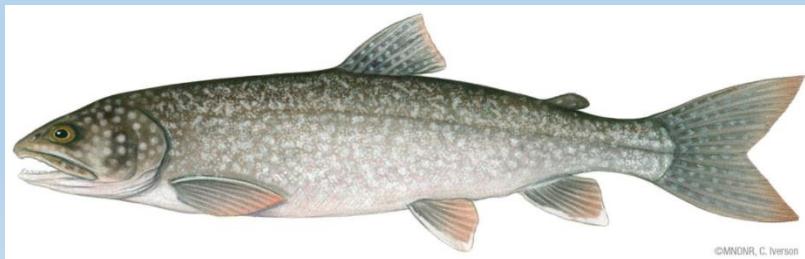

Anthropogenic Impact	Sample Size
Heavily Impacted/Wastewater Treatment Effluent	N=8
Developed	N= 10
Undeveloped/Wilderness	N= 9
Lake Superior	N=6

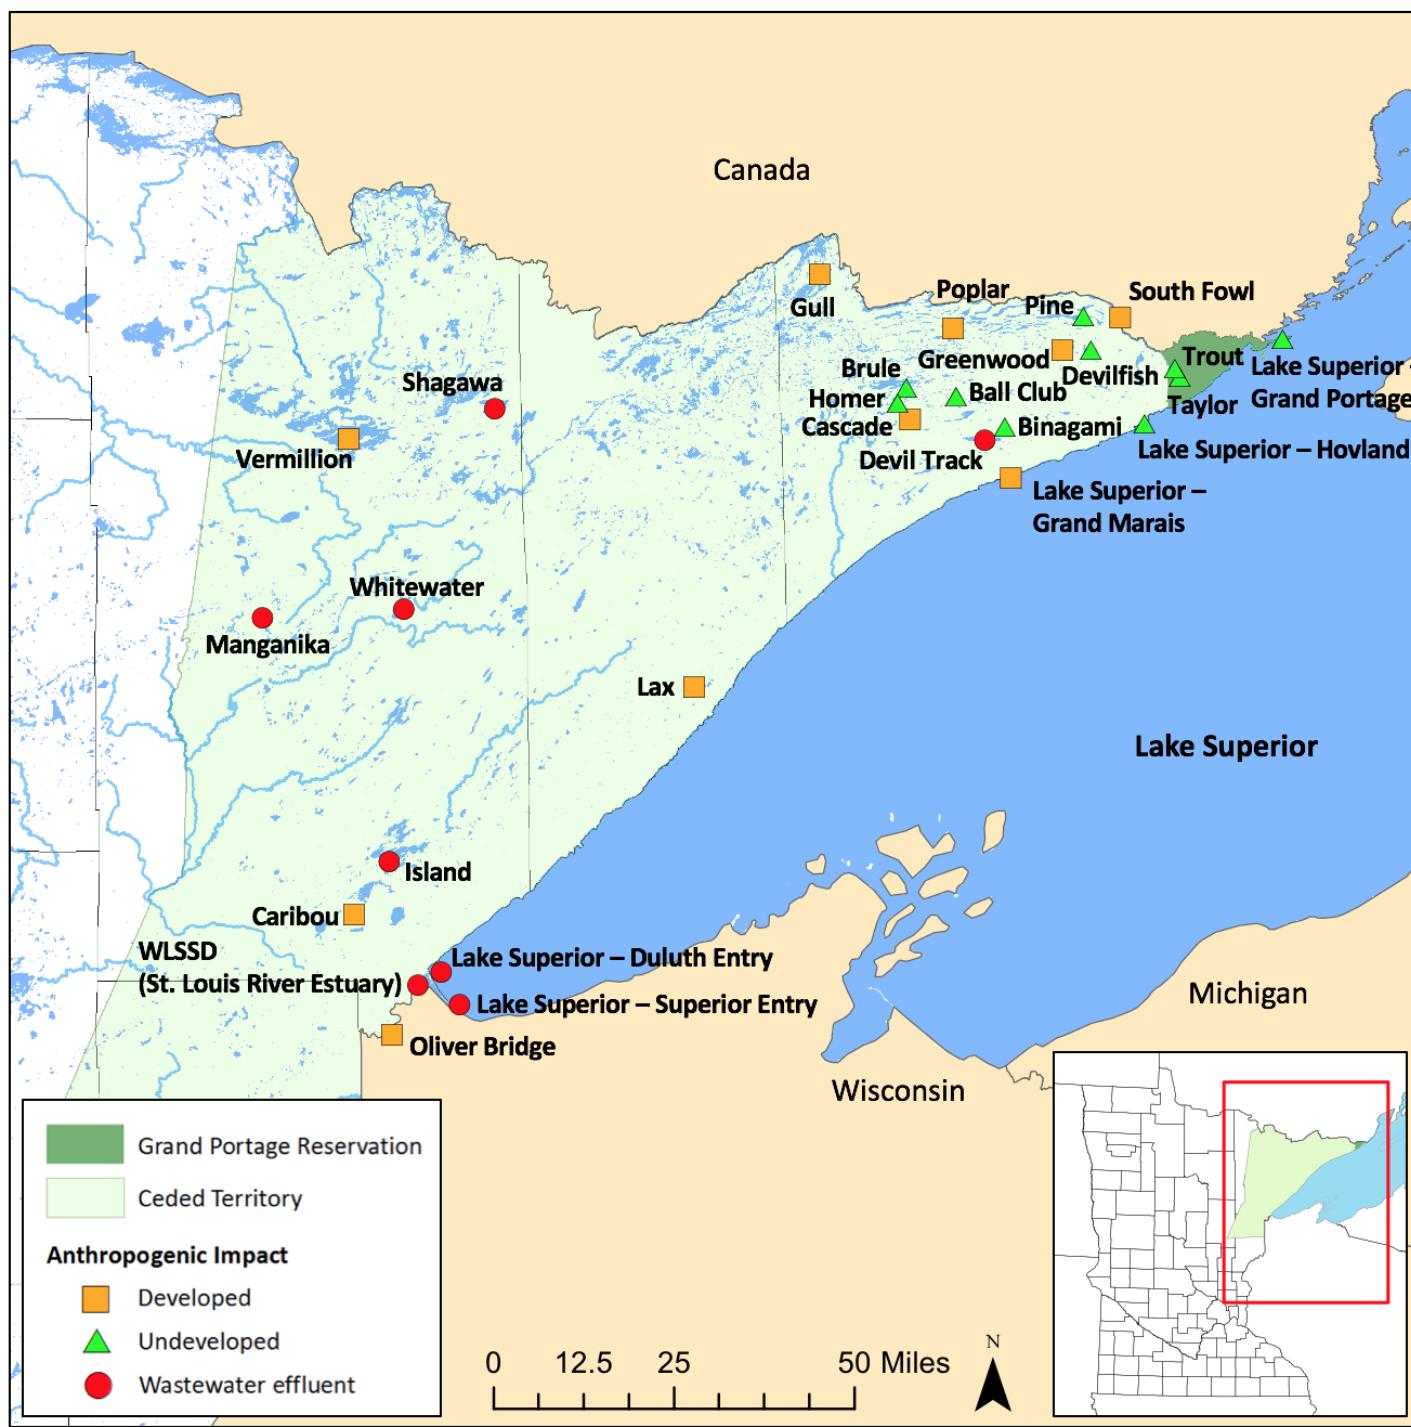

Sample collection

Walleye and Yellow Perch from 13 inland sites

Lake Trout and Cisco (Lake Herring) from 6 Lake Superior sites

Water samples

- 28 sites
- Screened 141 CECs (lists 1-6)
 - 93 CECs found in water samples (66% of those tested for)
- 1 – 77 detects in water samples per site
 - Undeveloped: 3 – 7 detects
 - Developed: 4 – 10 detects
 - Wastewater effluent: 49 – 84 detects
- Screened 16 hormones

Sediment samples

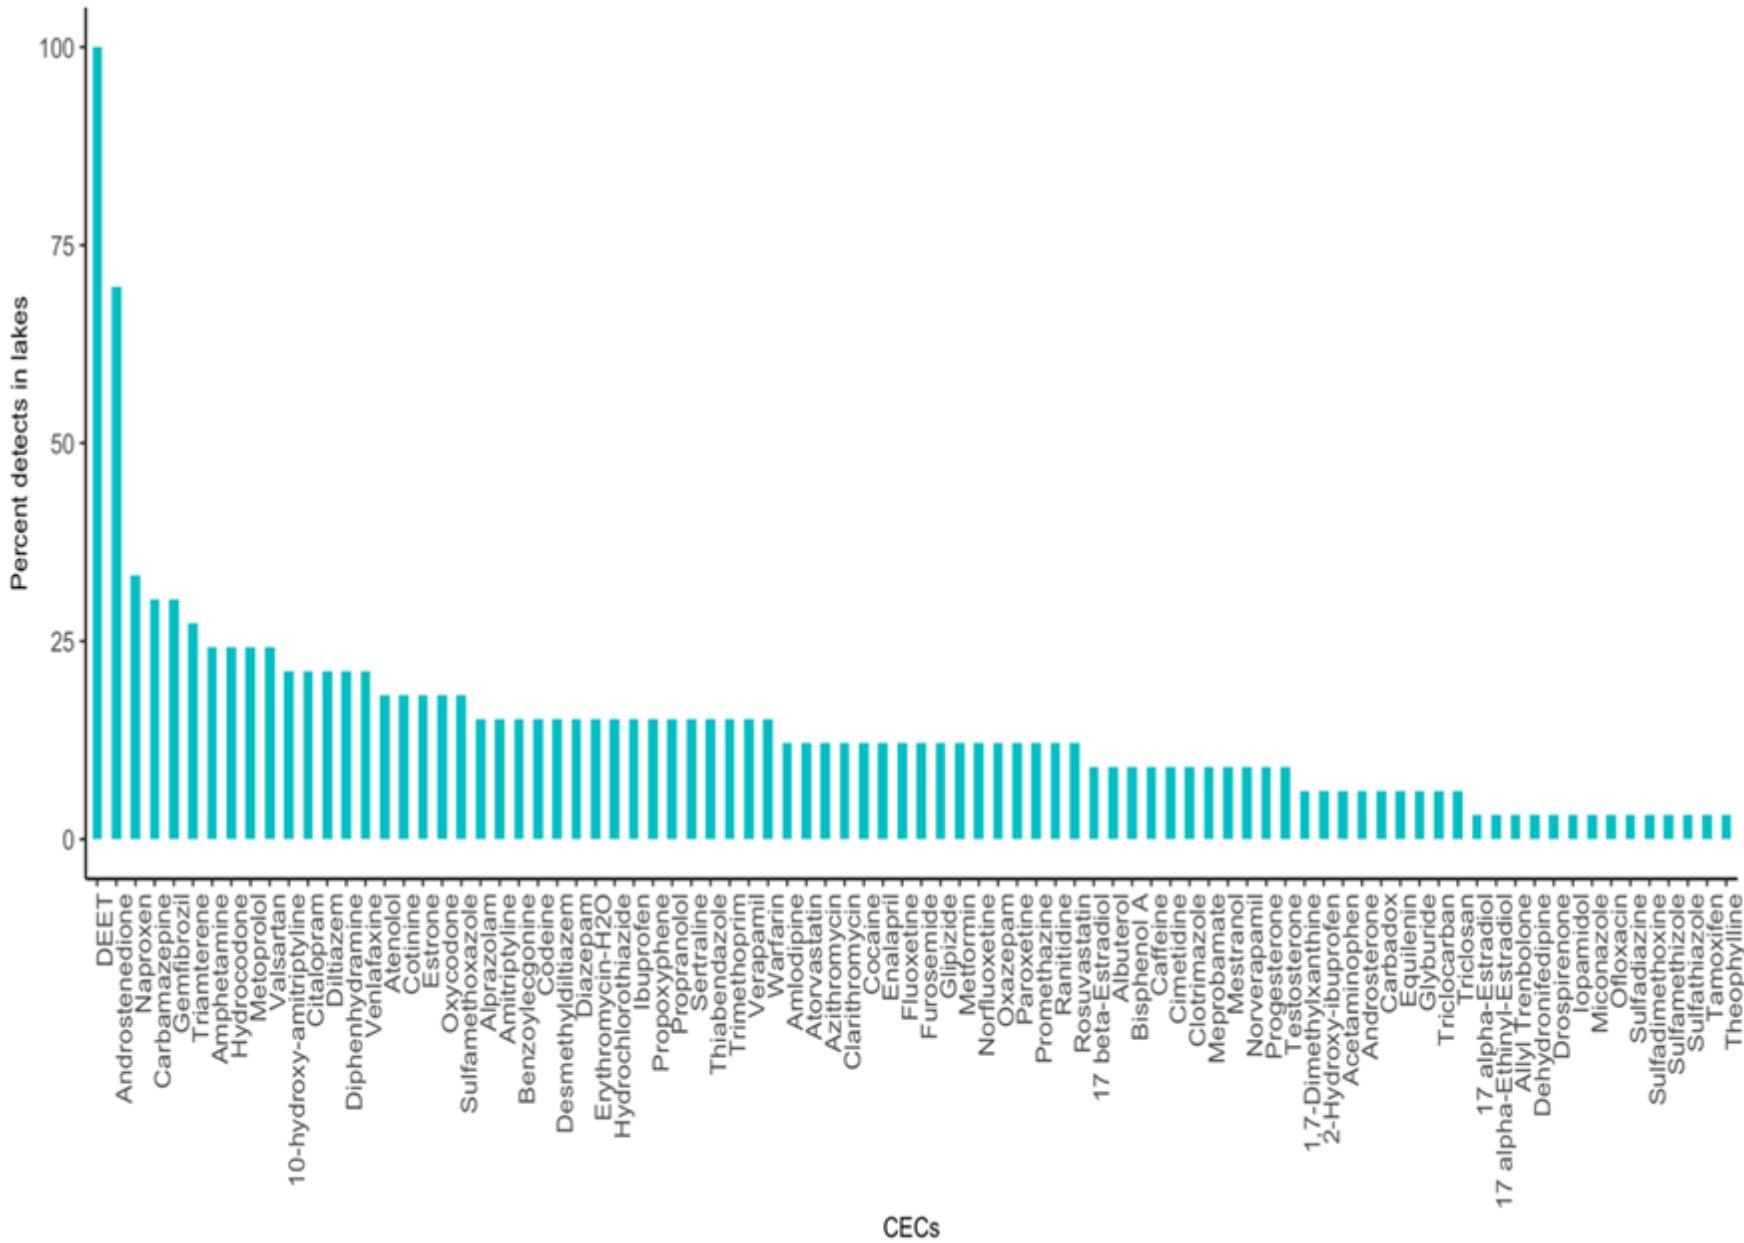

- 28 sites
- Screened 141 CECs (lists 1-6)
 - 57 CECs found in sediment samples (40% of those tested for)
- 2 – 59 detects in sediment samples per site
 - Undeveloped: 2 – 6 detects
 - Developed: 1 – 3 detects
 - Wastewater effluent: 3 – 59 detects

Fish samples

Subsistence species used:

- 28 sites
- Screened 141 CECs (lists 1-6)
 - 26 CECs found in fish samples (18% of those tested for)
- 1 – 7 detects in fish samples per site
 - Undeveloped: 1 – 5 detects
 - Developed: 1 – 7 detects
 - Wastewater effluent: 2 – 7 detects

Contaminants of emerging concern (CECs) in lakes across NE Minnesota

109 of 141 tested (77%) detected in samples across media and locations

Minnesota's Aquatic Toxicity Profiles (ATP)

- Developed to characterize the potential for contaminants detected in Minnesota's environment to cause adverse effects on aquatic life
 - ATPs: weight-of-evidence to determine potential impacts of specific contaminants in aquatic environments
 - Goal: to determine the contaminants of highest concern, when compared to other contaminants
 - Include: physicochemical properties, occurrence, toxicity, and production/importation volume

High priority contaminants are:

Water

- Estrone
- Progesterone
- Carbamazepine
- Gemfibrozil
- Mestranol
- DEET

Fish

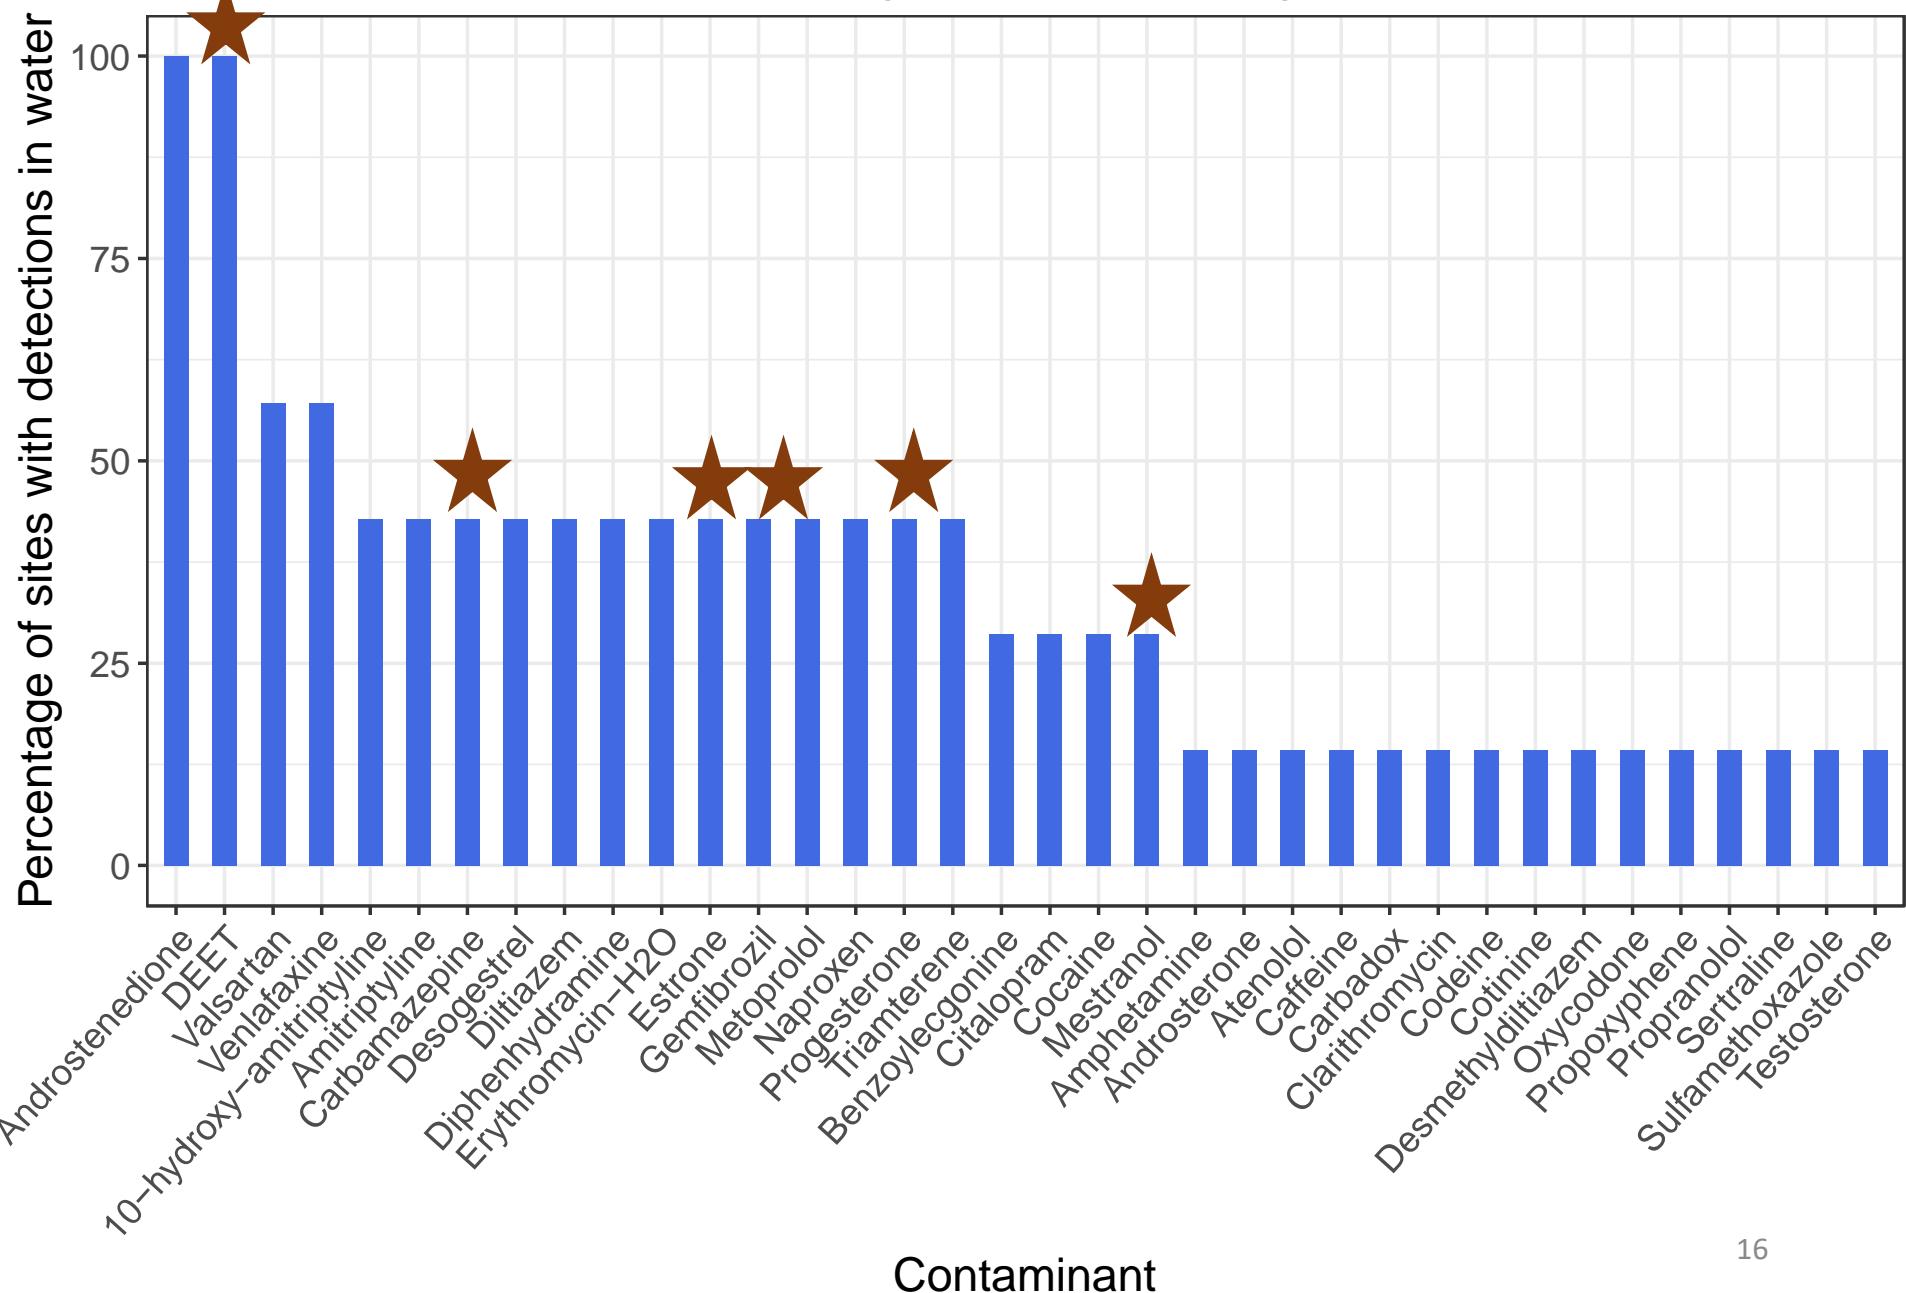

- Colchicine
- DEET

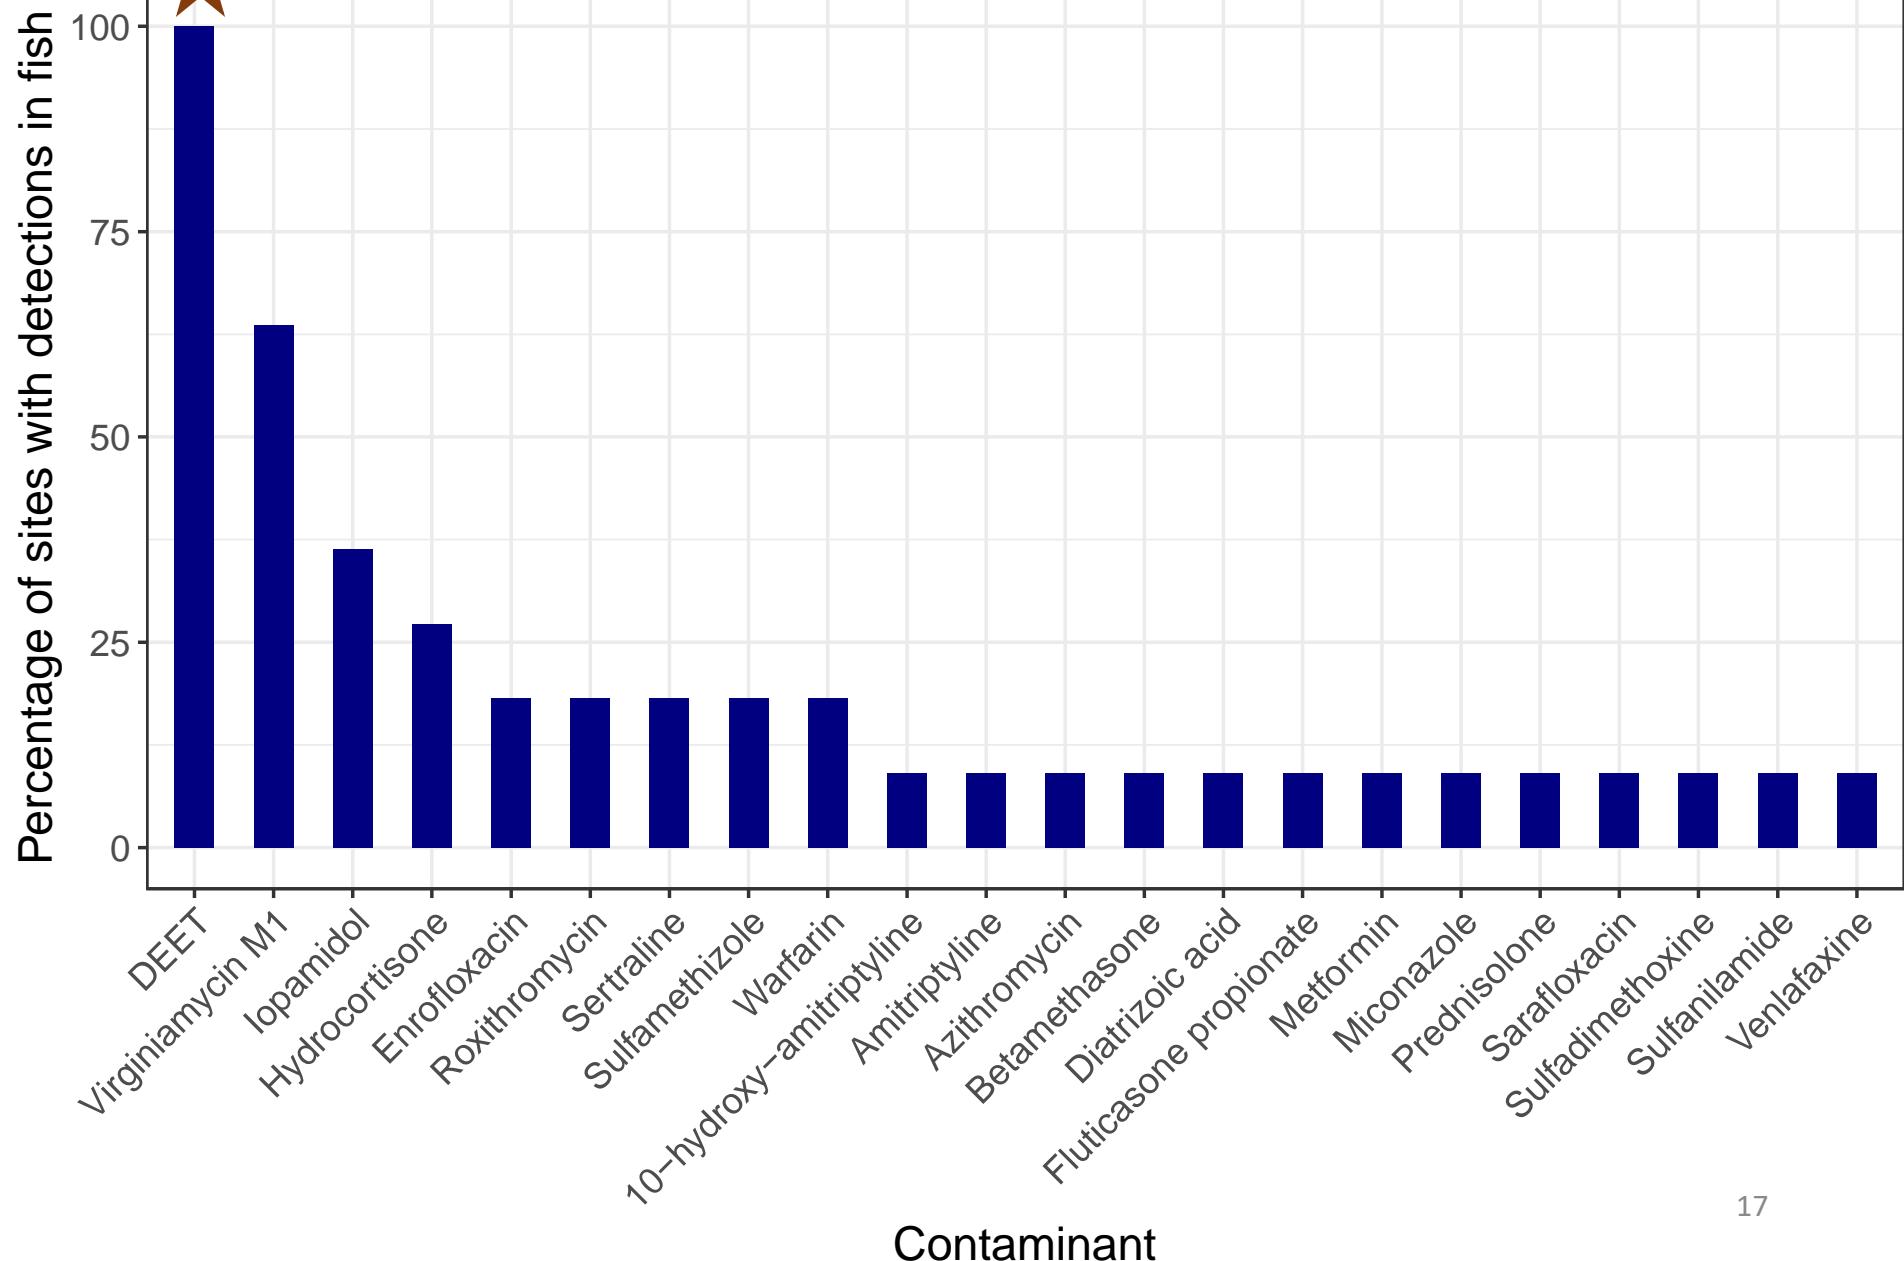

Sediment

- Mestranol
- Clotrimazole
- Triclocarban
- DEET

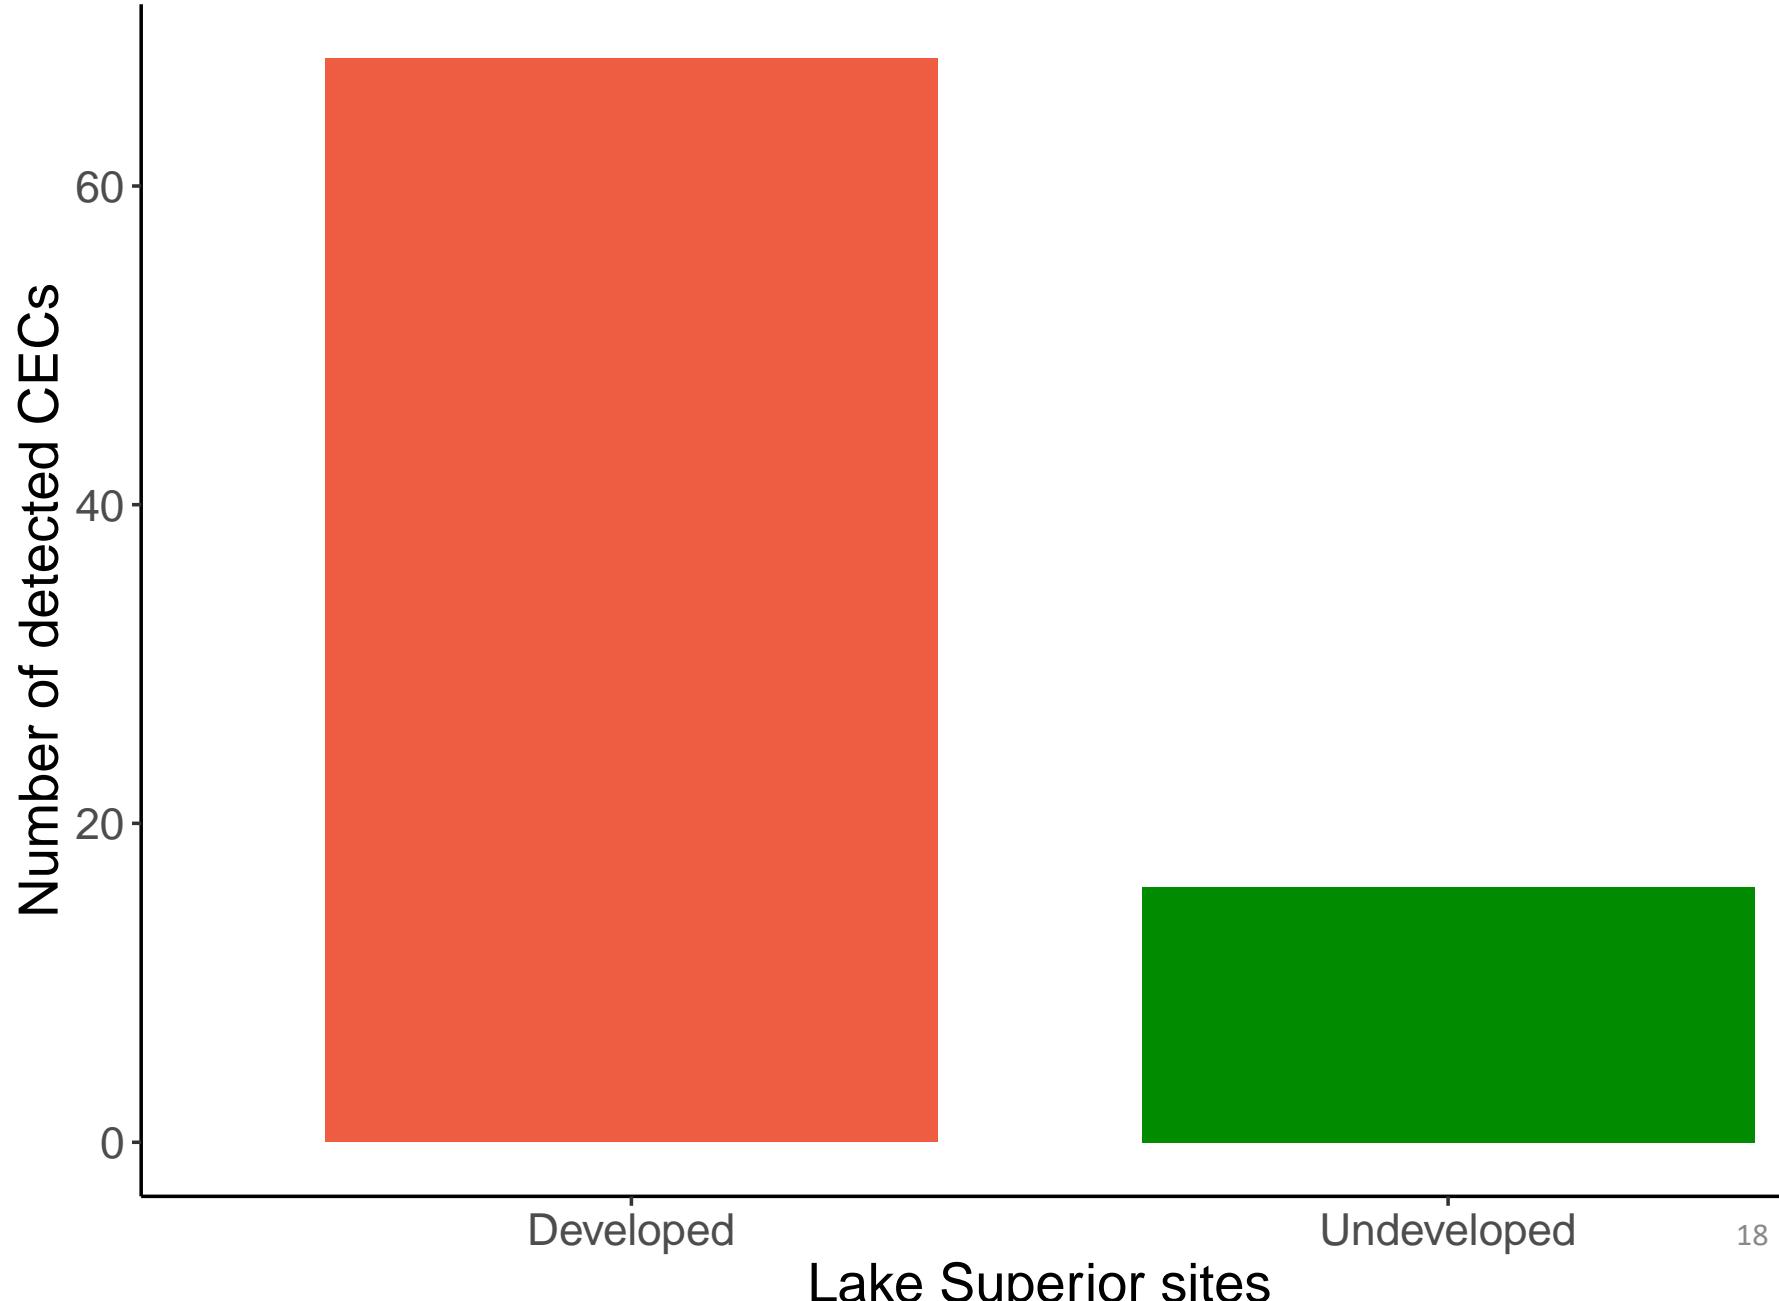

Detections of Contaminants of Emerging Concern (CECs) in Lake Superior water samples

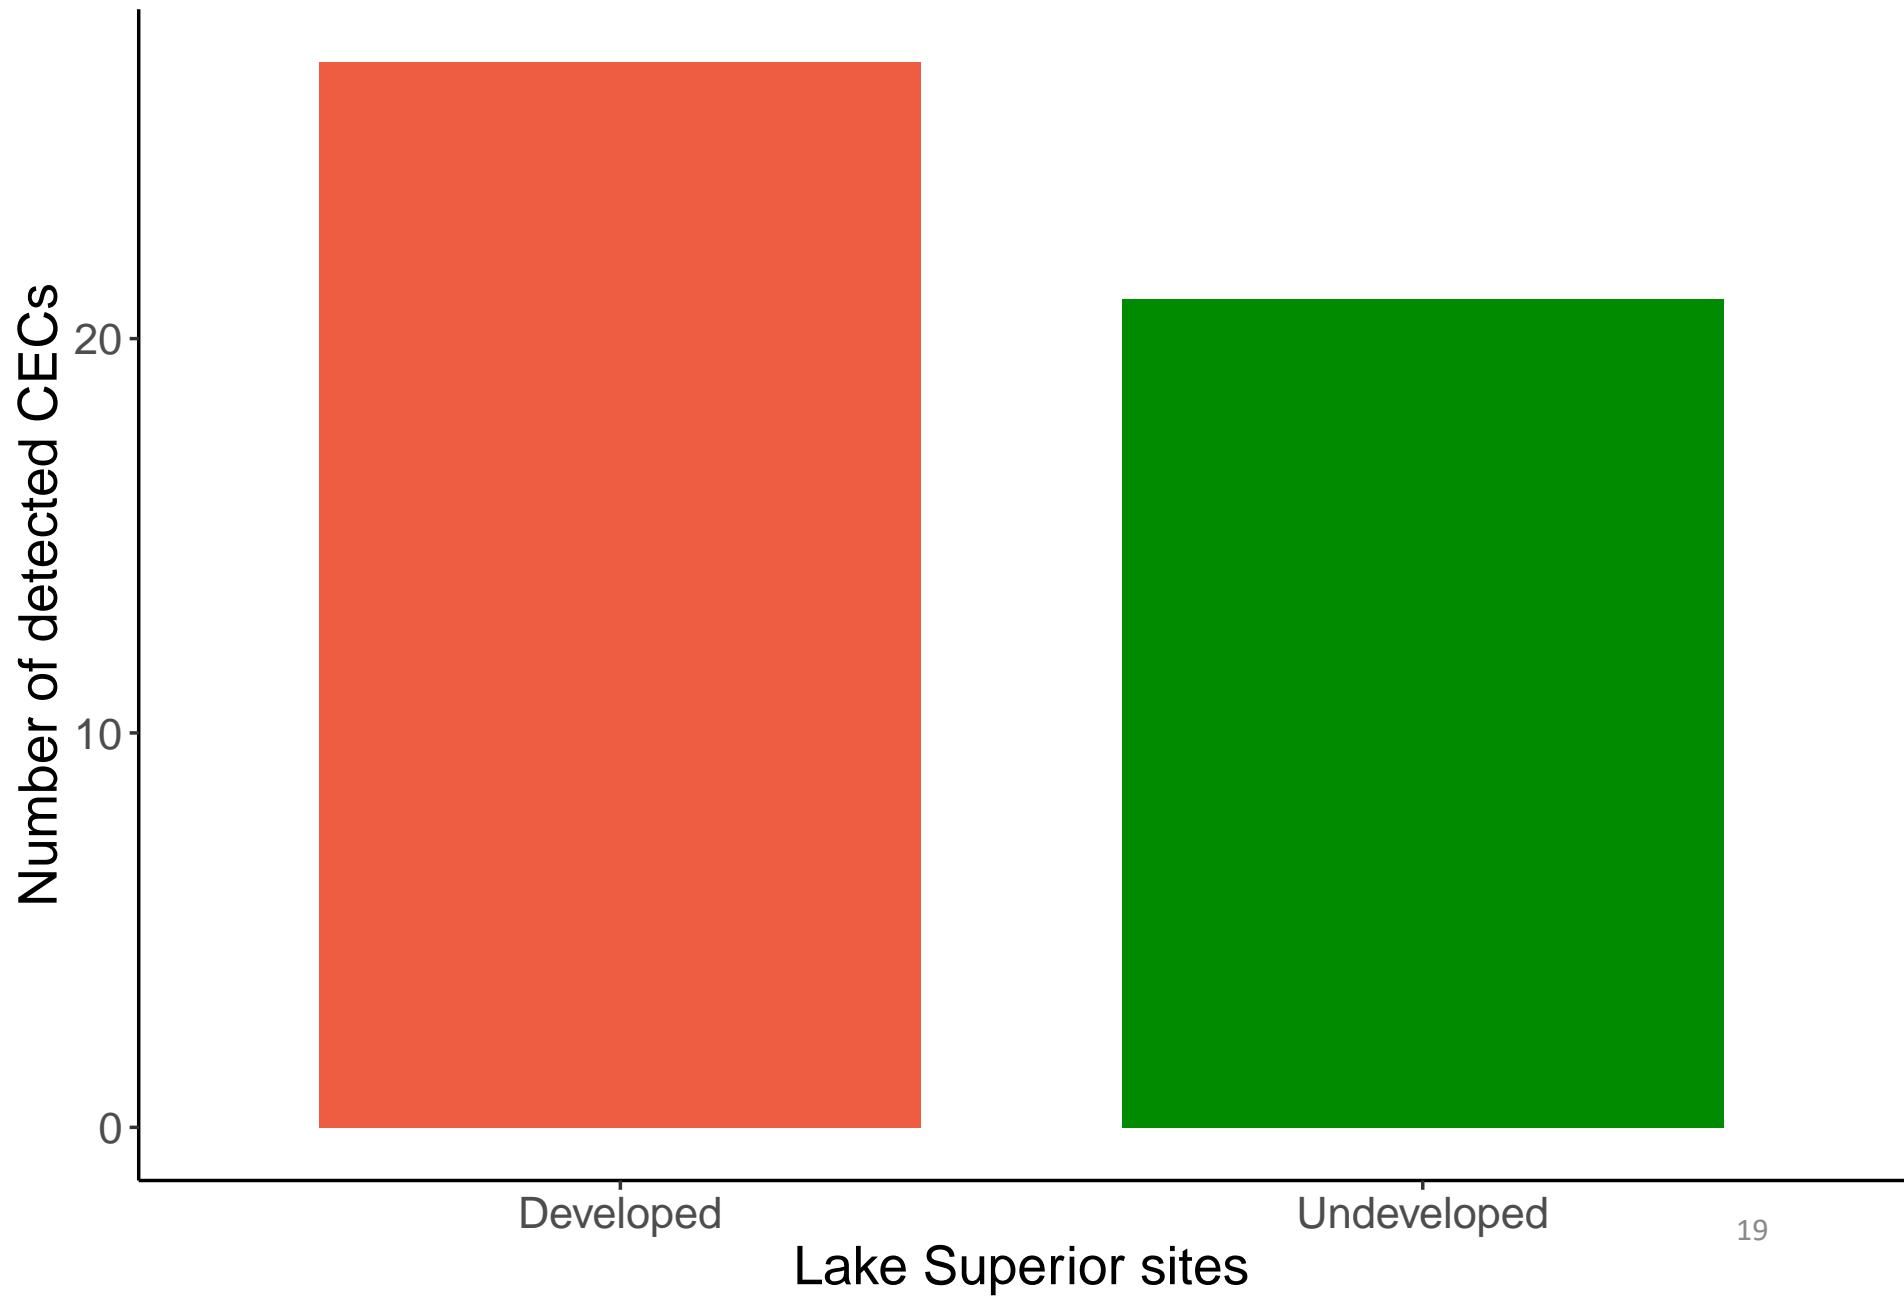

Detections of Contaminants of Emerging Concern (CECs) in Lake Superior fish samples

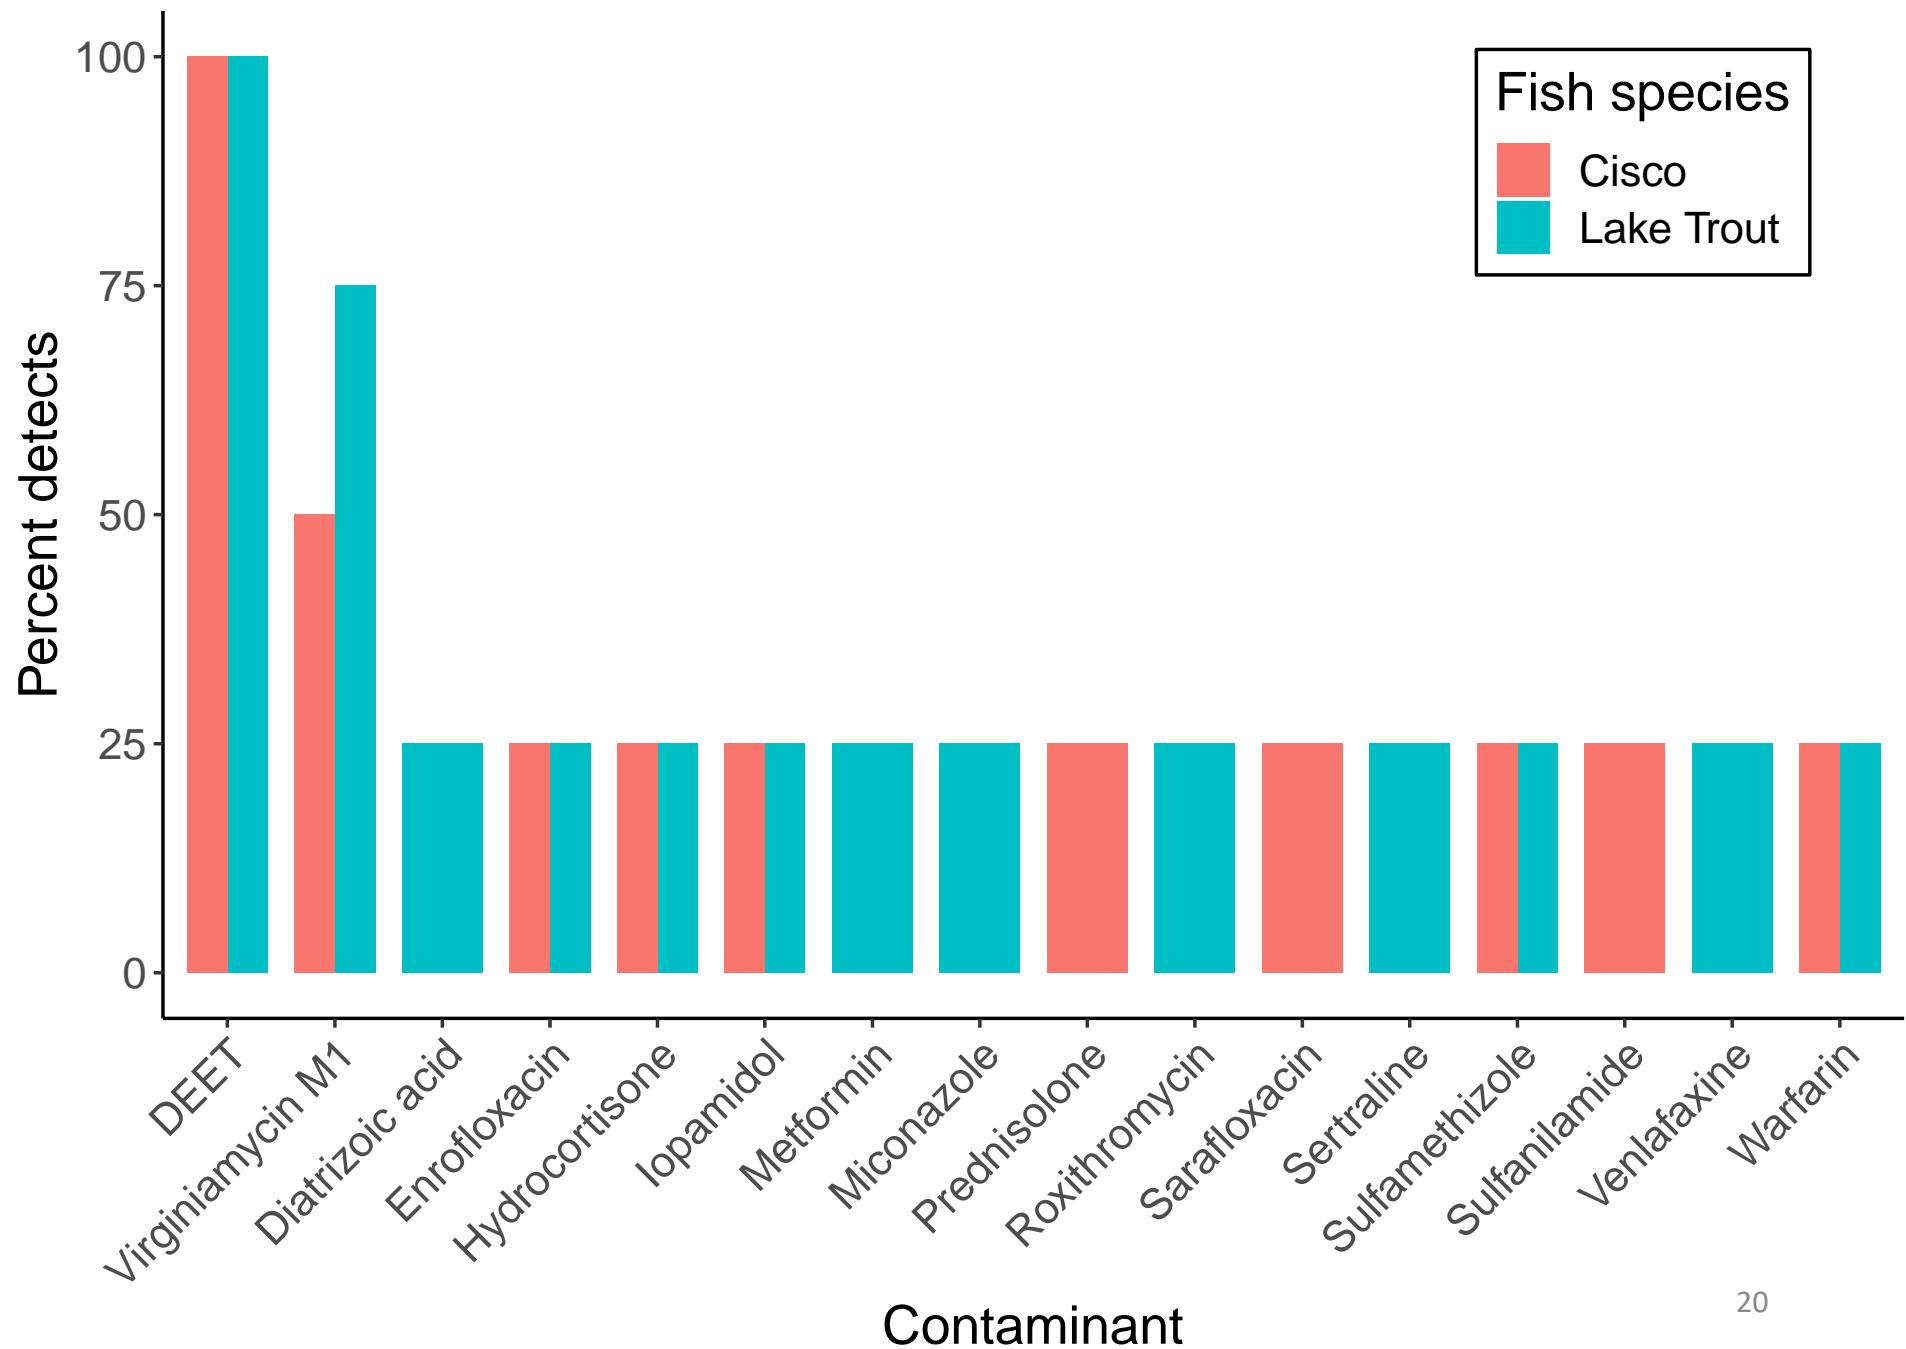

Contaminants of emerging concern (CECs) in Lake Superior water samples in 2016–2018

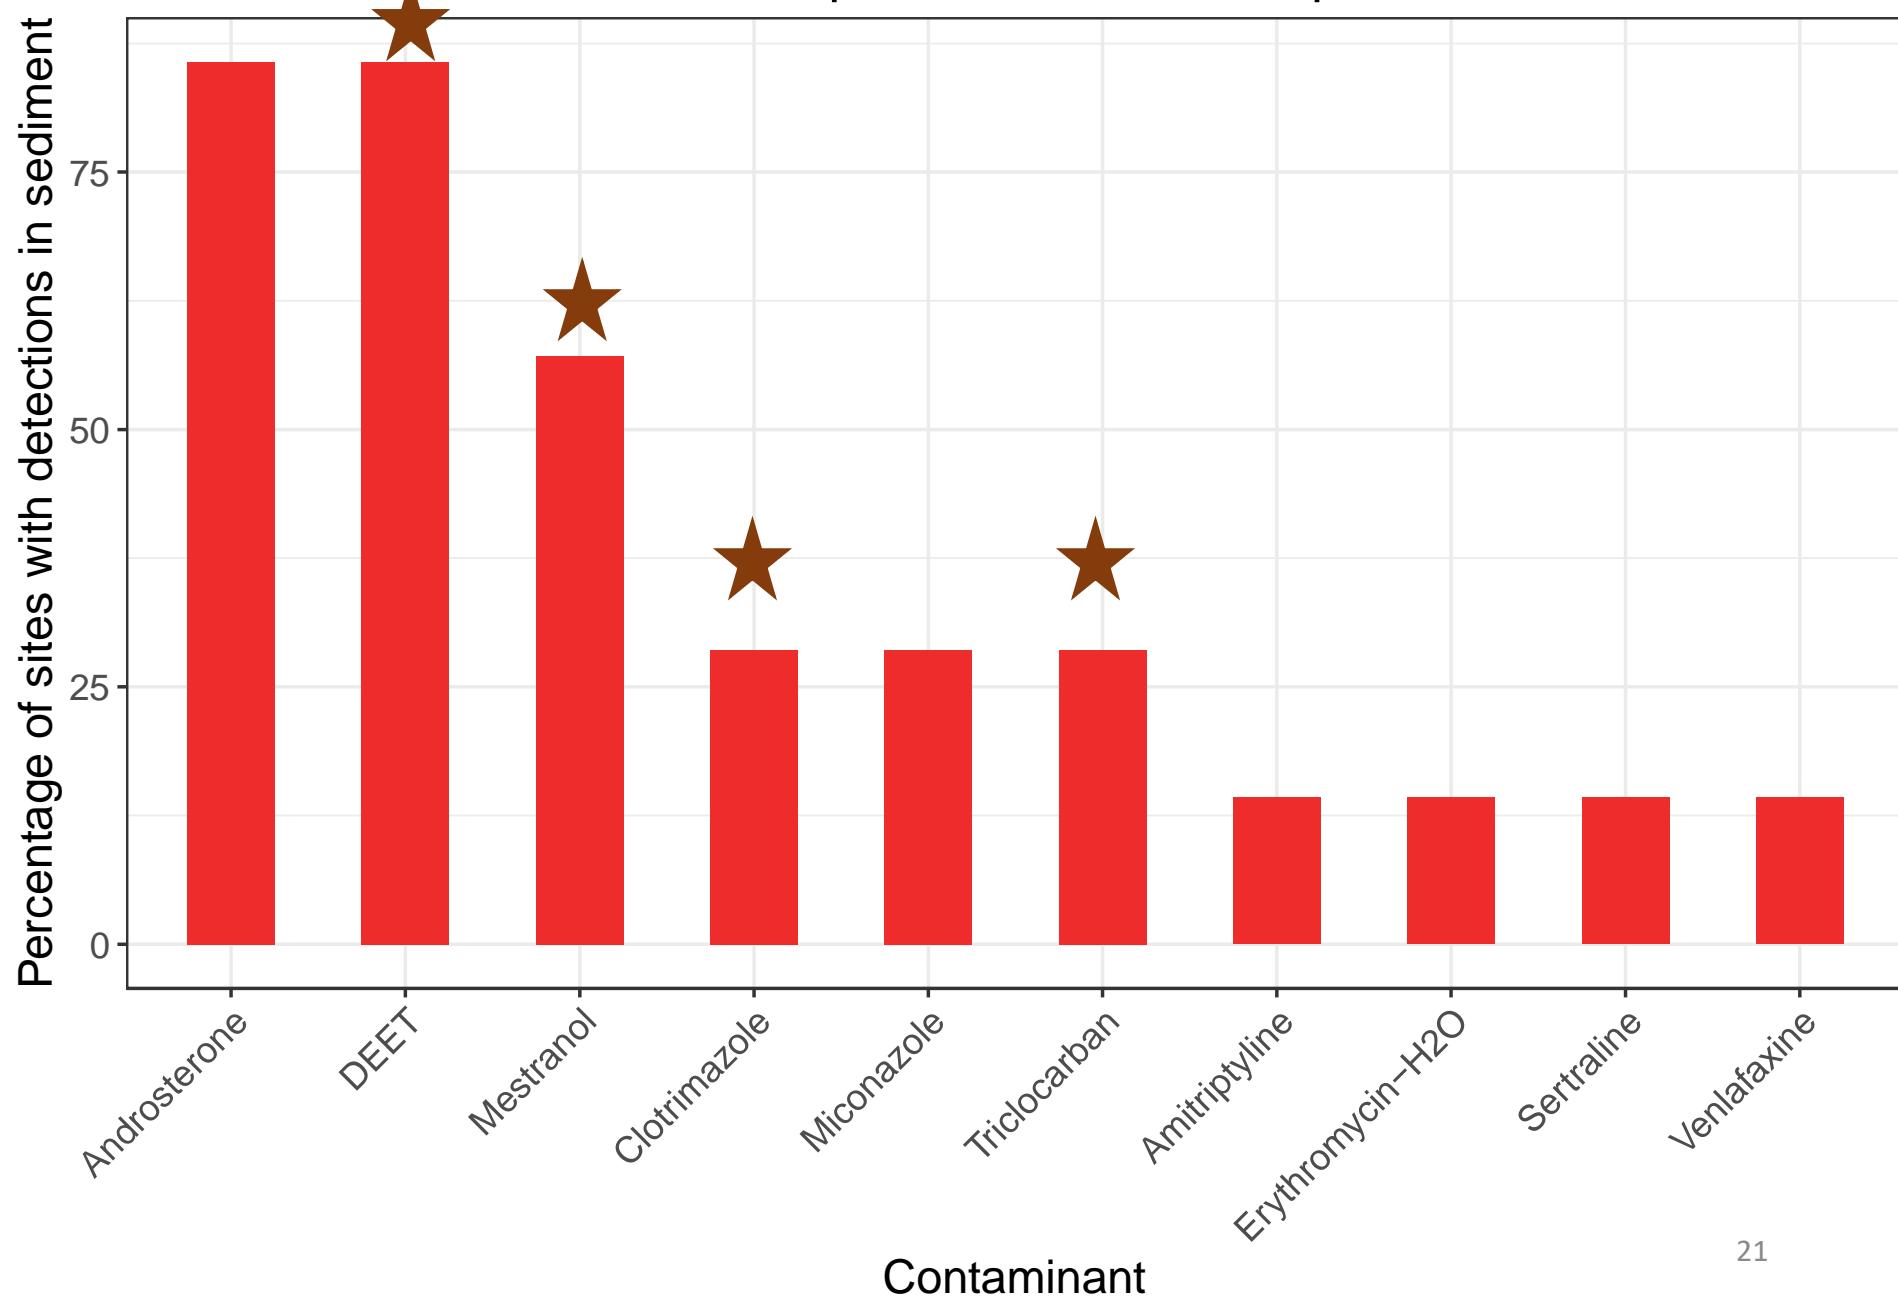

Contaminants of emerging concern (CECs) in Lake Superior fish samples in 2016–2017

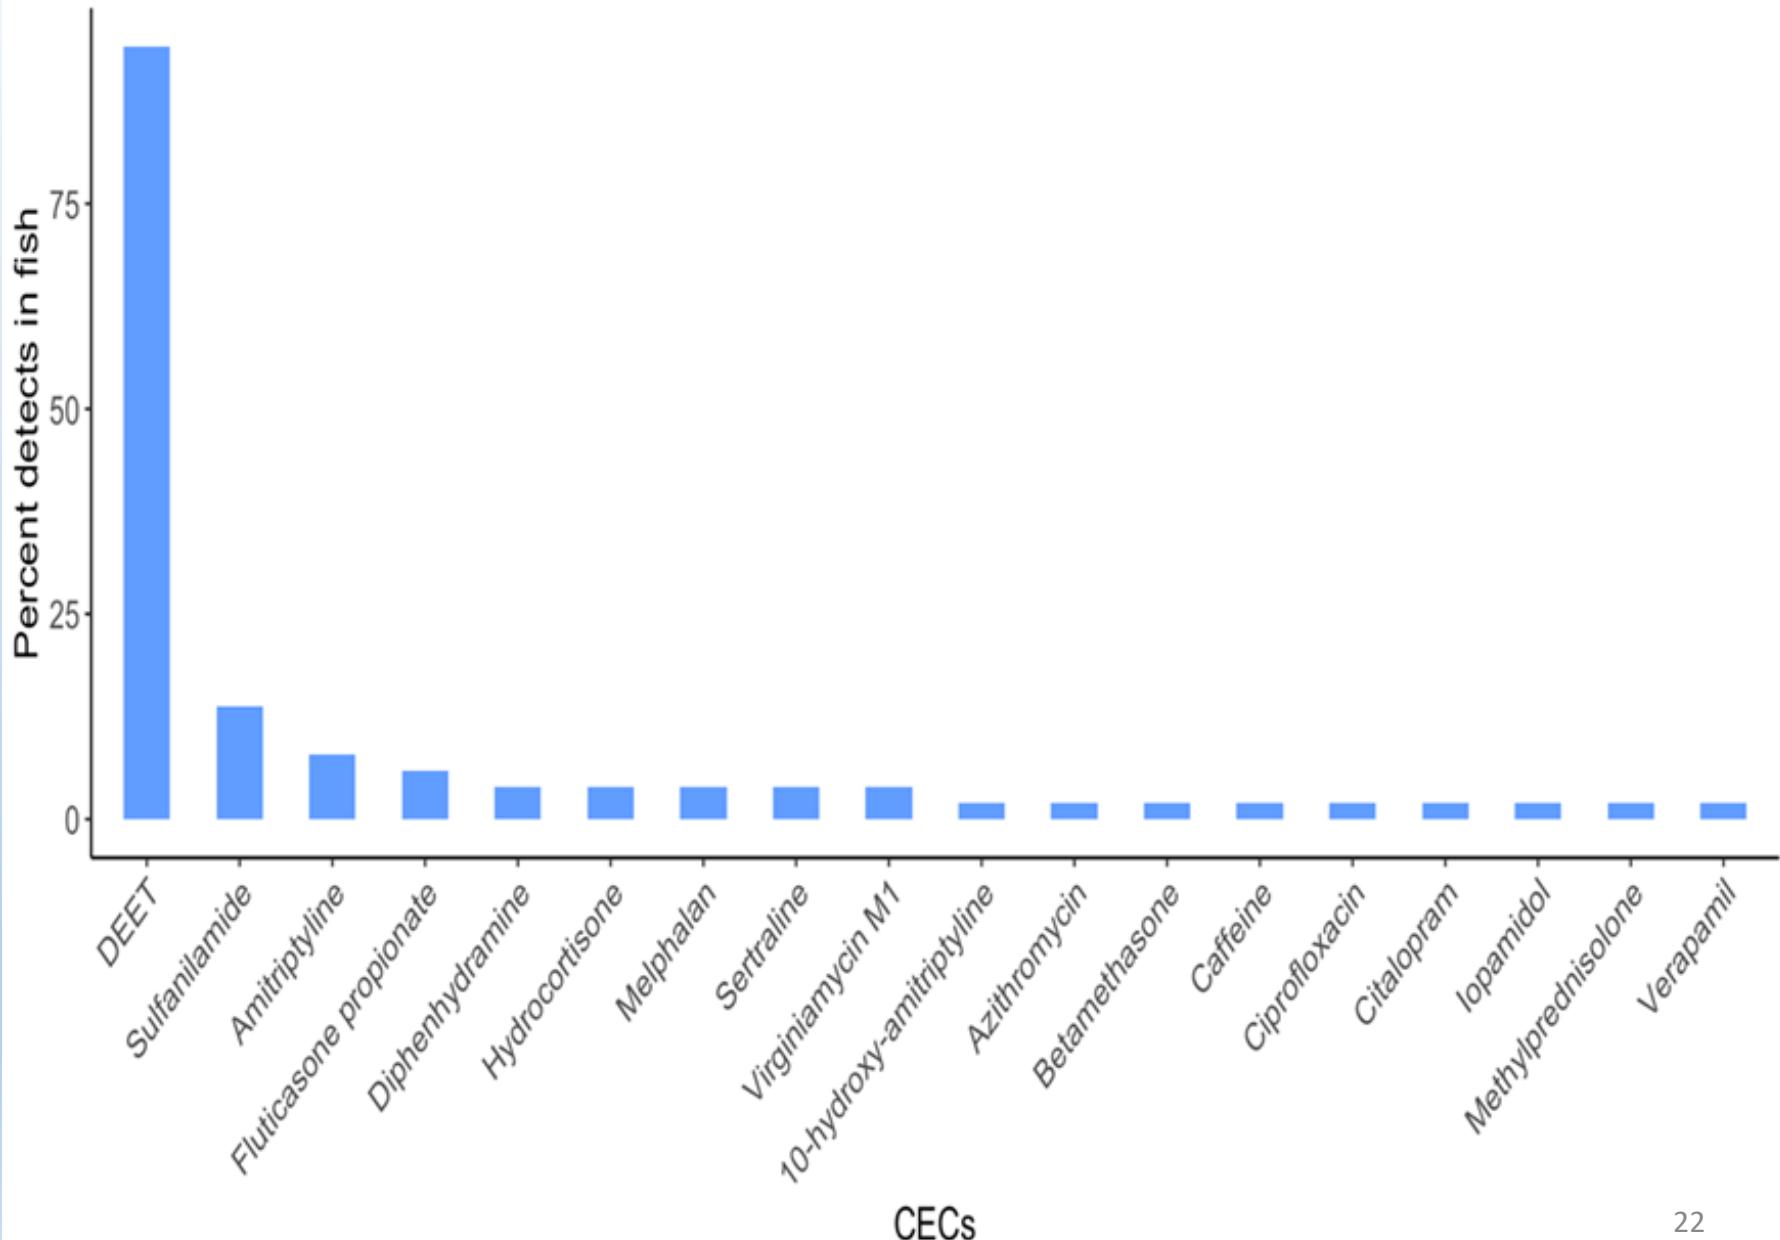

Contaminants of emerging concern (CECs) in Lake Superior fish in 2017

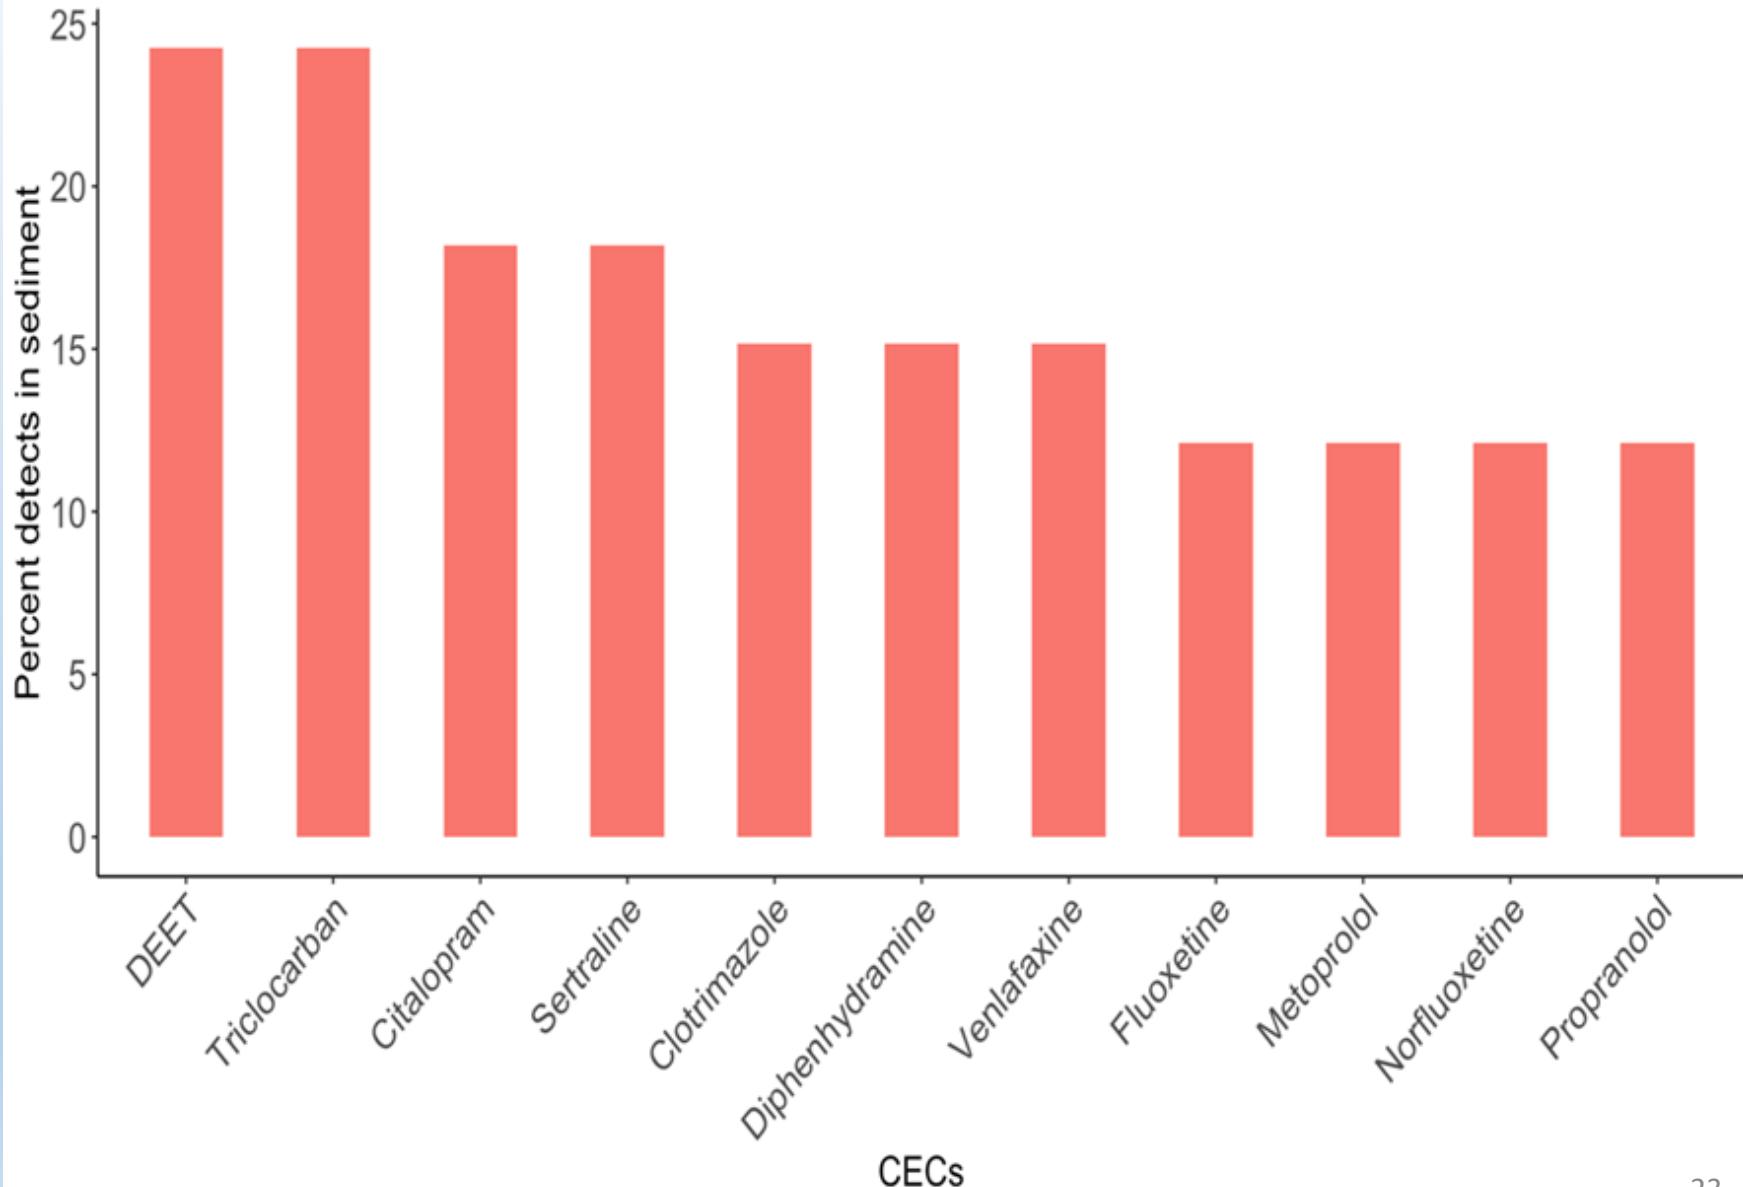

Detections of Contaminants of Emerging Concern (CECs) in Lake Superior sediment samples

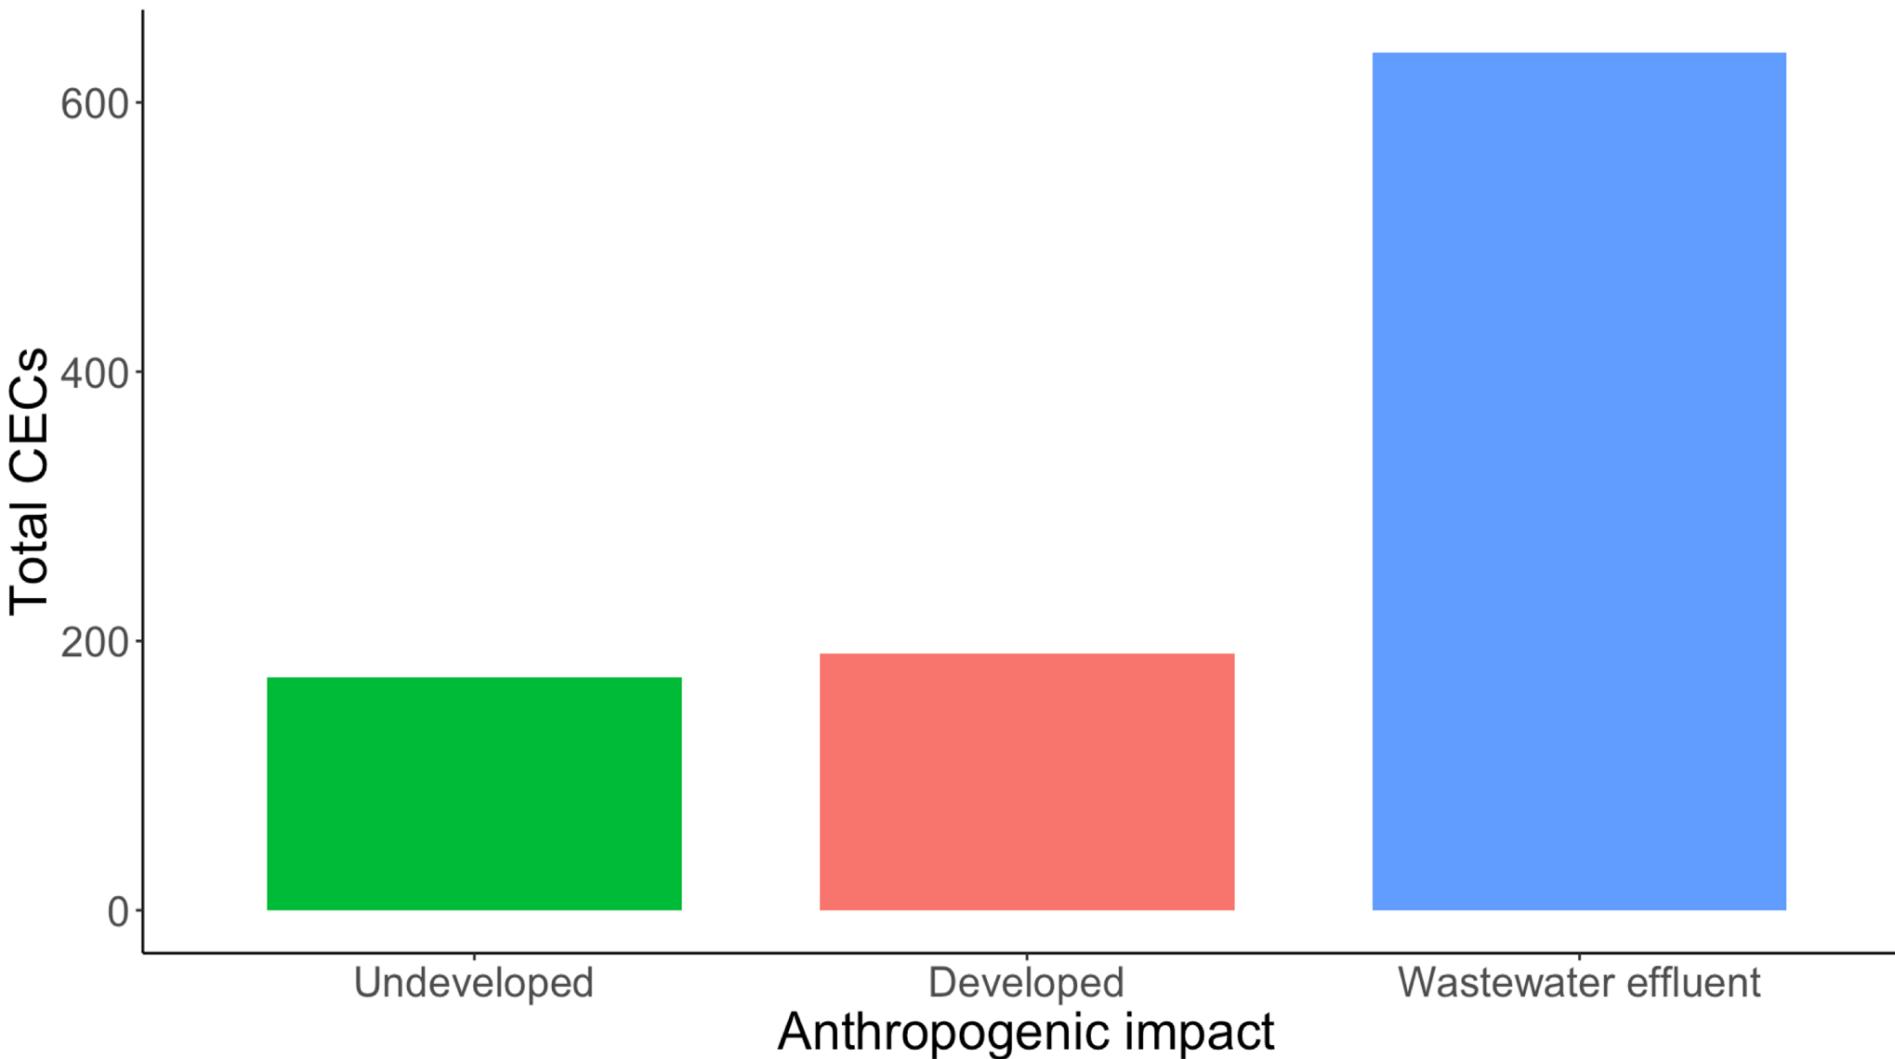

Contaminants of emerging concern (CECs) in fish across lakes in NE Minnesota

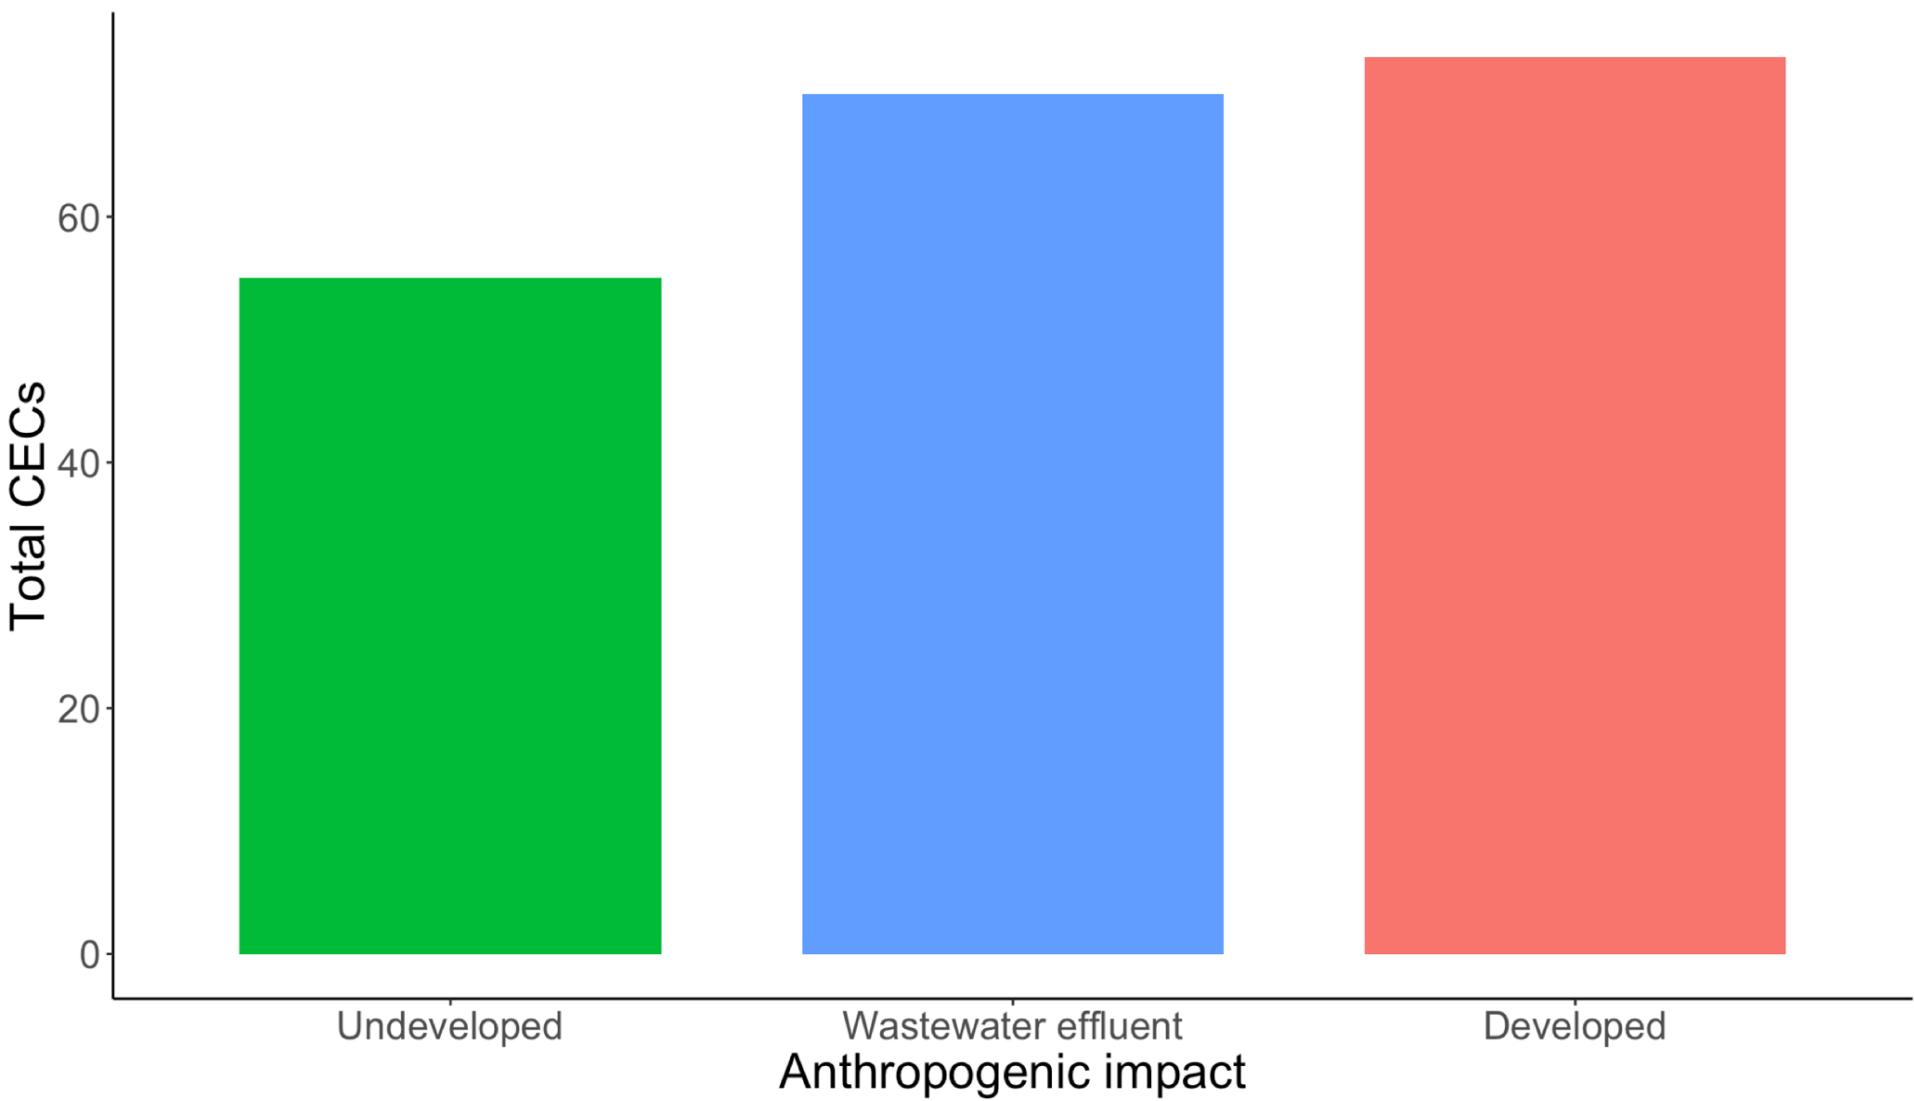

Contaminants of Emerging Concern (CECs) in sediment across lakes in NE Minnesota
Displaying CECs found in more than 10 percent of samples

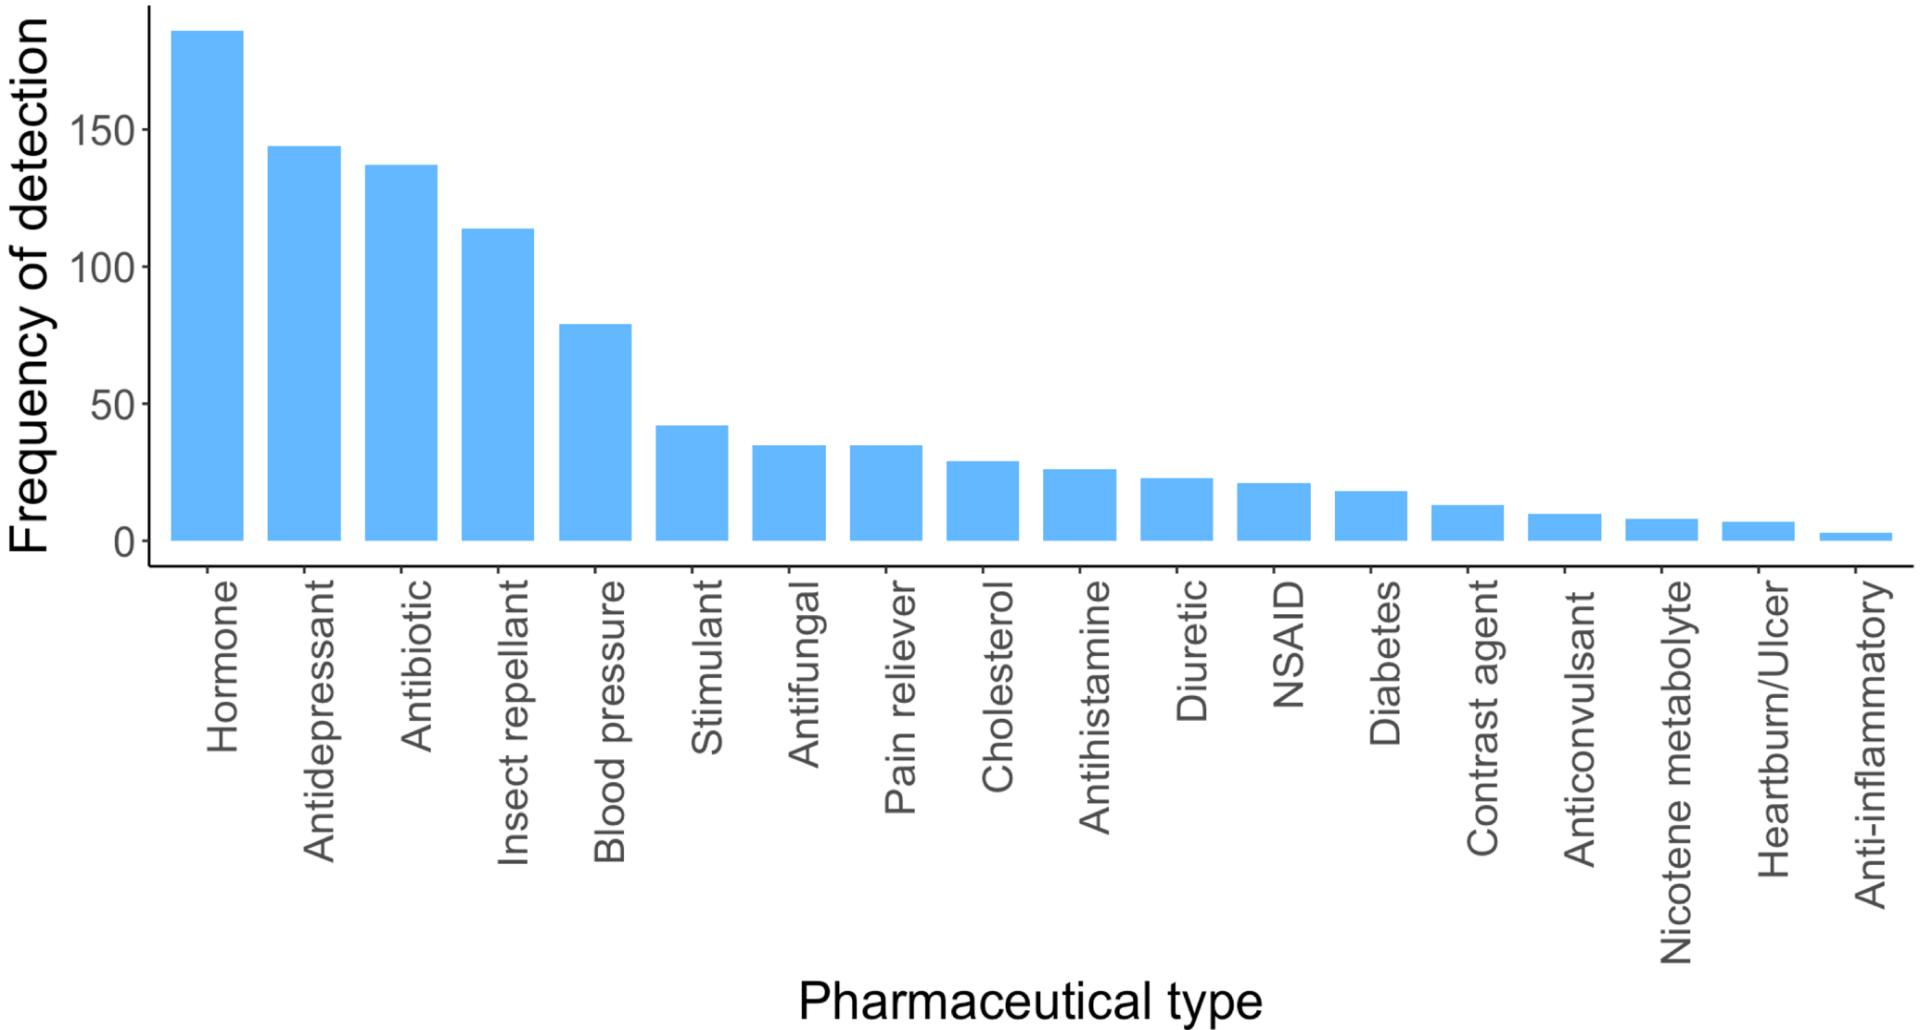

Contaminants of emerging concern (CECs) in water, sediment
and fish across NE Minnesota in 2016 and 2017

Contaminants of emerging concern (CECs) in fish across NE Minnesota in 2016 and 2017

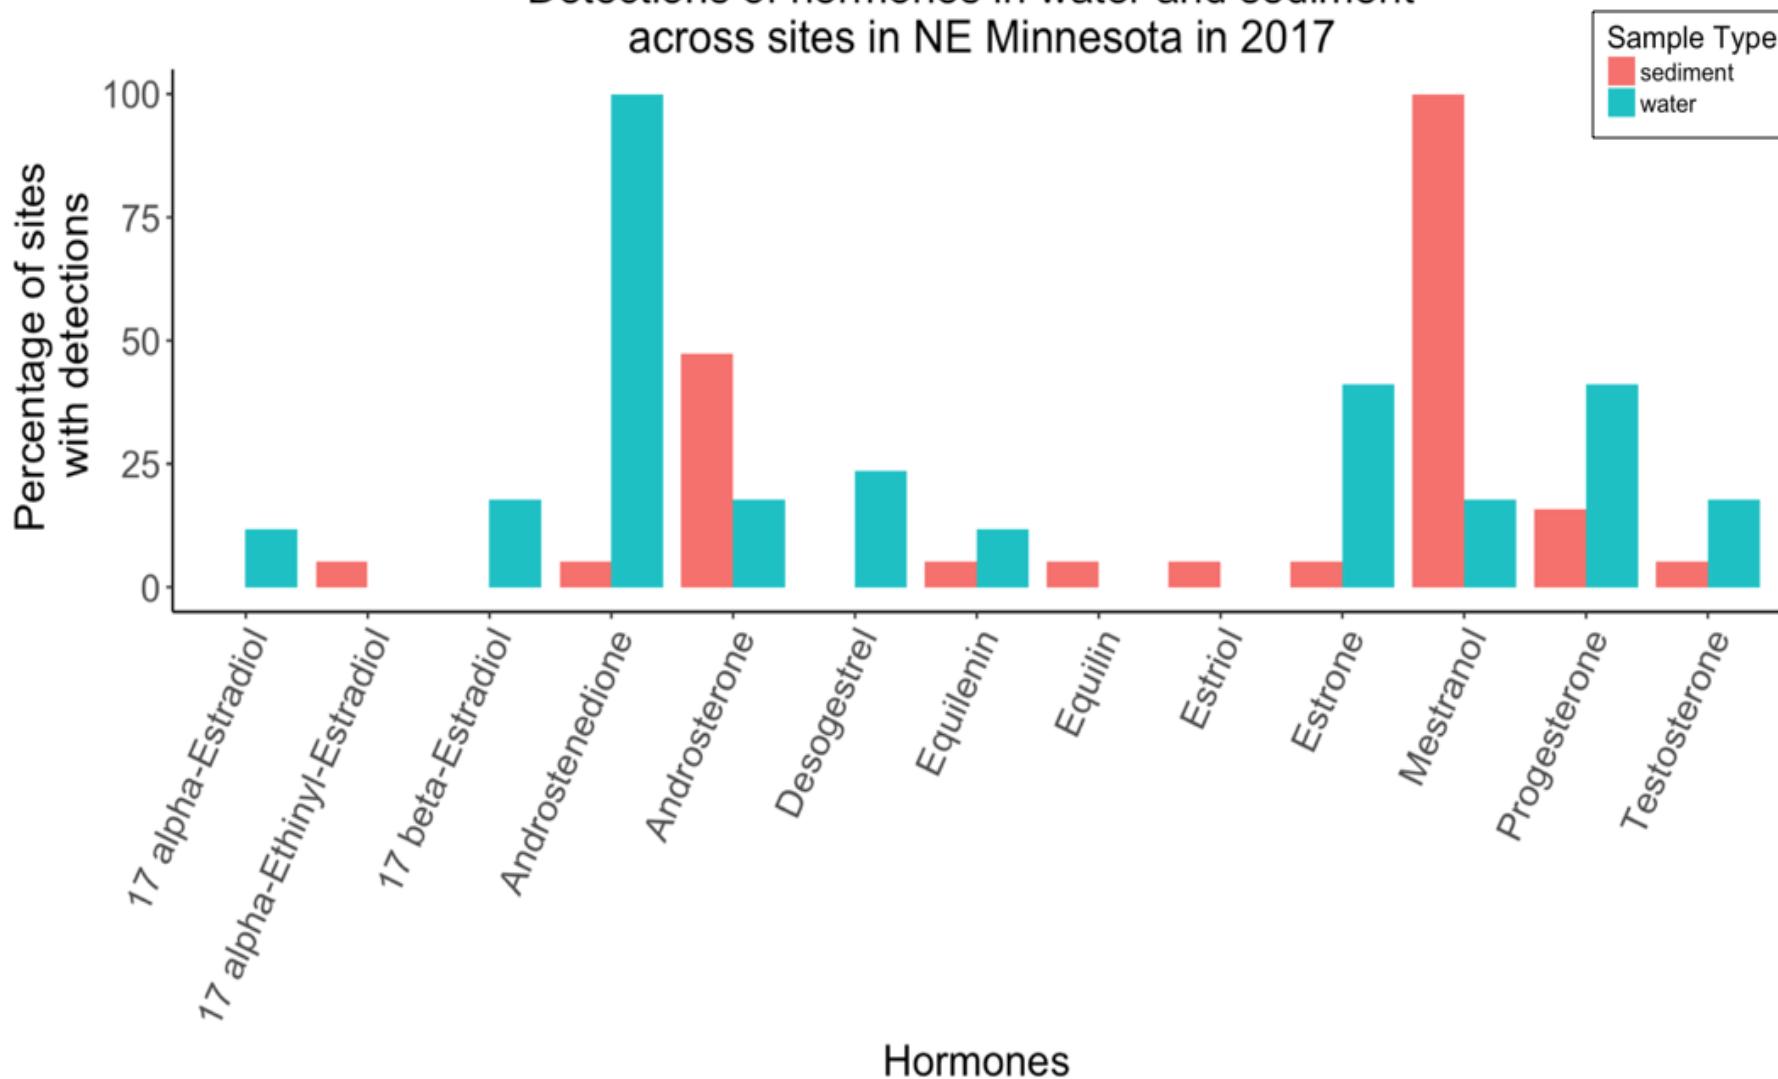

Pharmaceuticals found in water, sediment and fish across NE Minnesota in 2016 and 2017

Hormones

Detections of hormones in water and sediment across sites in NE Minnesota in 2017

Ray-finned fish in which exposure to hormones or hormone-active substances have been shown to cause sex reversal or severe aberrations in gonadal development

Concerns

- Hormones and Antidepressants most commonly found
- Desogestrel was found in ~16% of lakes
- Mestranol detected in 58% of sediment samples
- Anticancer drugs (antineoplastics) detections.
- Ubiquitous fish tissue detections of pharmaceuticals
- A widespread detection of contaminants in surface water and sediment – at undeveloped locations.

Management Implications

- What can we do?
- Prioritize CEC research
(LSWG-LaMP/CLC GLFC)
- Alter how prescripts are delivered
- Water Quality standards
- Wastewater treatment improvements
- Wastewater reuse

Next steps

- Tank studies to test what we find on fish in a lab setting
- Trend over time to identify trends in CEC's over time
- Wild Rice (at a regional scale)
- Wildlife subsistence species (moose, deer, bear, partridge)
- Index species
